

[Contract Table]

ส่วนประกอบ	รายละเอียด (Specification)
User Action	Click on "Hat" category on Frontend
HTTP Method	GET
Endpoint	/api/products
Query Parameter	category (e.g., ?category=Hat)
Gatekeeper Logic	Check if category exists, then filter data from JSON
Success Response	Status 200 + JSON Package { "status": "Success", "data": [...] }
Fail Response	Status 500 + JSON Package { "status": "Fail", "message": "..." }

[Sequence Diagram Description]

3. ส่วนของ GenAI Prompt (สำหรับใส่ในเอกสาร)

"Act as a Backend Architect. Write an Express.js route and controller logic that handles a GET request to /api/products. The route must accept a query parameter named 'category'. If the parameter exists, filter the products from a local JSON file. Return a JSON response with a 'status' field (Success/Fail) and a 'data' field containing the results. Follow the Controller-Route-Service pattern."
